

MAYFAIR CHAIR

FEATURES

Frame - the fully welded frame is constructed of 32mm round steel tube with a wall thickness of 1.4mm. The front leg is welded, not bent, this means that overall the chair is stronger and unlikely to collapse in the front at weakened bent junctures.

Back Support - the backrest consists of strong MDF covered with 80mm foam for maximum comfort.

Seat - the seat is fully supported by the frame for additional strength. The seat features elastic webbing which gives further comfort in addition to the contoured foam. The 80mm thick foam with a seat width of 540mm and a depth of 470mm means unequalled comfort for the customer.

OPTIONS

The Mayfair is available with or without arms and as a single or two-seater variety to suit reception or conference applications. The arms are able to have pads attached for additional comfort if required.
